AB The specificity of binding of a zinc finger to a triplet or quadruplet nucleotide target subsite depends upon the location of the zinc finger in a multifinger protein and, hence, upon the location of its target subsite within a larger target sequence. The present disclosure provides zinc finger amino acid sequences for recognition of triplet target subsites having the nucleotide G as the 5'- nucleotide of the subsite, that have been optimized with respect to the location of the subsite within the target site. Accordingly, the disclosure provides finger position-specific amino acid sequences for the recognition of GNN target subsites. This allows the construction of multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biol. activity.

AB Synthetic C2H2 zinc finger proteins that bind to DNase I-hypersensitive sites in the vascular endothelial growth factor (VEGF) gene and that can be used to regulated gene expression and angiogenesis are described for use in treatment of ischemia, in wound healing, and other diseases associated with angiogenesis. The VEGF-A gene was analyzed to identify DNase I hypersensitive sites and an array of synthetic zinc finger domains fused to VP16 or NF- κ B p65 were designed and tested for their ability to bind to constitutively and conditionally hypersensitive sites. Fusion products containing 6 zinc fingers were shown to regulate transcription of the gene. When gene expression was induced by hypoxia, the pattern of splice variants from the gene was comparable found in control cells.

AB The invention provides methods and compns. for regulating angiogenesis, such methods and compns. being useful in a variety of applications where modulation of vascular formation is useful in treatments for ischemia and wound healing. Certain of the methods and compns. accomplish this by using various zinc finger proteins that bind to particular target sites in one or more VEGF genes. Nucleic acids encoding the zinc finger proteins are also disclosed. Methods for modulating the expression of one or more VEGF genes with the zinc finger proteins and nucleic acids are also disclosed. Such methods can also be utilized in a variety of therapeutic applications that involve the regulation of endothelial cell growth.

Pharmaceutical compns. including the zinc finger proteins or nucleic acids encoding them are also provided.

AB The invention provides criteria and methods for selecting optimum subsequence(s) from the promoter region of animal vascular endothelial growth factor (VEGF) gene for targeting by a zinc finger protein. The invention also provides methods of designing zinc finger protein segments (seven contiguous amino acids) that bind to a preselected target site. The targeting sequences in the promoter region of VEGF and the sequences of segment of zinc finger proteins were disclosed. The expression of zinc finger protein segments stimulated the expression of VEGF in human, mouse and rat cells. The ZFP provides in this invention can be used to modulate the expression of VEGF for treatment of diseases such as atherosclerosis, ischemia, arthritis, injury and tumors.

WO 2001-US43438 W 20011120

AB The present disclosure provides zinc finger amino acid sequences for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite, that have been optimized with respect to the location of the subsite within the target site. Accordingly, the disclosure provides finger position-specific amino acid sequences for the recognition of GNN target subsites. This allows the construction of multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biol. activity. The Cys2-His2-type zinc finger DNA-binding proteins can be engineered to bind specifically to many different DNA sequences. A single zinc finger typically binds to a 3-4-base pair DNA subsite. One strategy for design is to identify highly specific fingers that recognize each of the 64 possible DNA triplets. The authors started with a subgroup of the 64 triplets, the GNN-binding fingers. The GNN-binding fingers have been examined in several studies, but previous studies did not produce specific fingers for all of the 16 GNN triplets. These previous studies did not provide any information on the possible positional or context effects on the performance of these fingers. To identify the most specific design and take the possible positional effects into consideration, the authors did a large-scale site selection experiment on our GNN designs. From this study, the authors identified very specific fingers for 14 of the 16 GNN triplets, demonstrating for the first time a clear positional dependence for many of the designs. Further systematic specificity study reveals that the in vivo functionality of these zinc finger proteins in a reporter assay depends on their binding affinities to their target sequences, thus giving a better understanding of how these zinc finger proteins might function inside cells.

Property values tagged with IC are from the ZIC/VINITI data file
 provided by InfoChem.

STRUCTURE FILE UPDATES: 18 FEB 2004 HIGHEST RN 651705-73-6
 DICTIONARY FILE UPDATES: 18 FEB 2004 HIGHEST RN 651705-73-6

TSCA INFORMATION NOW CURRENT THROUGH JULY 14, 2003

Please note that search-term pricing does apply when
 conducting SmartSELECT searches.

Crossover limits have been increased. See HELP CROSSOVER for details.

Experimental and calculated property data are now available. For more
 information enter HELP PROP at an arrow prompt in the file or refer
 to the file summary sheet on the web at:
<http://www.cas.org/ONLINE/DBSS/registryss.html>
